In feed: Add 5 g to 100 g of dry or canned feed.

Notice: Consult with your veterinarian about the recommended dosage depending on the size of the bird.

Get sunlight.

Mode of action

Most breeders of ornamental birds during the breeding and maintenance period may have digestive problems such as bloating, diarrhea, indigestion and abdominal pain or infections such as salmonellosis, infection with E.coli, inflammatory bowel disease, Listeriosis, streptococcus infection, Infections with Campylobacter and... have seen. In fact, most of the problems are due to the imbalance between the beneficial and harmful microorganisms (dysbiosis) in the bird's digestive tract that results from poor nutrition, stress, illness, or antibiotic use. In most cases, by eating feces, the bird tries to bring useful germs into its digestive system to help digest food. The use of a suitable probiotic can be a good solution for preventing and confronting these problems in ornamental birds.

Advantages

- Improve immune system function
- Reduced intestinal infections
- Reduced and improved diarrhea
- Improved appetite and health
- Refreshed and recharged bird
